

DRH - Scene Material Inventory

User Manual · Version 1.0.0 · Blender 4.2+

Overview

DRH - Scene Material Inventory audits the materials, reachable shader nodes, referenced images, PBR map roles, and related scene data used by a Blender project. It turns that inspection into structured HTML, XLSX, or CSV reports for cleanup, handoff, production documentation, and technical review.

Product	DRH - Scene Material Inventory
Version	1.0.0
Blender	4.2 or later
Platforms	Windows, macOS, Linux
Location	3D Viewport > Sidebar > DRH Tools > Material Inventory
Distribution	Official release through BlendKit
Dependencies	No third-party Python packages required

Quick start

- Download the current release from the official BlendKit product page.
- In Blender Preferences, use Get Extensions > Install from Disk and select the downloaded ZIP.
- Enable DRH - Scene Material Inventory if required.
- Open the 3D Viewport sidebar and select DRH Tools > Material Inventory.
- Choose the report options required for the review.
- Enable image information and PBR map details when deeper texture/shader diagnostics are needed.
- Choose HTML, XLSX, or CSV and export the report.

What the inventory covers

Materials	Material identity, scene usage, Blender user counts, material-slot references, node state, and shader types.
Shader nodes	Reachable node trees, nested groups, node counts, shader types, and Principled BSDF usage.
Images	Referenced image sources, resolution/context, packing state, alpha use, file size, and missing-file review where applicable.
PBR maps	Common map roles, shader targets, naming fallback, packed-channel hints, alpha use, and color-space review hints.
Collections	Optional per-collection material breakdown for larger or structured scenes.
Environment	Report-generation context needed to interpret the export.

PBR interpretation

PBR roles use shader connectivity where possible and image/node names as a fallback or supplement. Common packed-channel naming conventions such as ORM, ARM, RMA, and MRA can be recognized. Color-space results are review hints rather than hard errors because custom shader workflows can intentionally differ.

Report formats

HTML	Self-contained report with search, filters, sorting, collapsible sections, environment information, optional collection details, and optional PBR-map details.
XLSX	Workbook with typed numeric cells, frozen headers, native Excel tables, and optional PBR Maps and Collections sheets.
CSV	UTF-8 BOM material inventory. When PBR details are enabled, a sibling _PBR-Maps.csv file can also be generated.

Accuracy and review notes

- Unique scene objects are counted separately from material-slot references.
- Reachable shader node groups are scanned recursively.
- PBR roles prefer shader connections and use naming as fallback/supplement.
- UDIM paths use known Blender image tiles when available.
- Alpha use is based on linked Image Texture Alpha outputs.
- Deterministic ordering helps make repeat reports easier to compare.

Privacy and path handling

Path sanitization is enabled by default. Local home-directory prefixes are replaced with %USERPROFILE% on Windows or ~ on macOS/Linux so exported reports do not expose the operating-system username by default.

Saved report setup

Extension Preferences expose the main report options used in the Material Inventory panel. Save Scene as Defaults stores the current reporting setup; Apply to Scene restores the saved profile. Scene settings remain editable after defaults are loaded, allowing a standard reporting baseline with project-specific adjustments.
