

DRH - Scene Material Inventory

Interim user guide · Version 1.0.0 · Blender 4.2+

Purpose

Scene Material Inventory audits material use across a Blender scene and exports a structured report. It reviews materials, reachable shader nodes, referenced images, common PBR map roles, and optional collection-level details.

Location

3D Viewport > Sidebar > DRH Tools > Material Inventory

Quick start

- Open the scene you want to review.
- Open the Material Inventory panel.
- Choose the report options needed for the review.
- Enable image information when image-level diagnostics are required.
- Enable the PBR map breakdown when you need map-role and shader-target details.
- Choose HTML, XLSX, or CSV and export the report.

Report coverage

Area	Reported information
Materials	Unique scene-object use, Blender user counts, material-slot references, node state, and shader types.
Images	Image source details, file checks, resolution/context details, and missing-file review where applicable.
PBR maps	Common map roles, traced shader targets, naming fallback, packed-map hints, alpha use, and color-space review hints.
Collections	Optional per-collection material breakdown.
Environment	Report-generation context needed to interpret the export.

Export formats

HTML: self-contained report with search, filters, sorting, environment information, optional collection details, and optional PBR map details.

XLSX: workbook with typed numeric cells, frozen headers, Excel tables, and optional PBR Maps and Collections sheets.

CSV: UTF-8 BOM material inventory. When PBR details are enabled, a sibling `_PBR-Maps.csv` file is also generated.

Accuracy notes

- Unique scene objects are counted separately from material-slot references.
- Reachable shader node groups are scanned recursively.
- PBR roles use shader connections when possible and image or node names as a fallback or supplement.
- Color-space results are review hints, not hard errors; custom shader workflows can intentionally differ.
- UDIM paths use known Blender image tiles when available.
- Alpha use is based on linked Image Texture Alpha outputs.

Privacy

Path sanitization is enabled by default. Local home-directory prefixes are replaced with `%USERPROFILE%` on Windows or `~` on macOS/Linux. The operating-system username is not exported.

Support and distribution

This GitHub repository contains documentation and support material; it does not host the installable add-on ZIP. Use GitHub Discussions for setup or workflow questions and GitHub Issues for reproducible bugs, regressions, compatibility problems, or focused feature requests.
